NOTES:
1. Construct the entrance to the slope drain of a standard flared-end section of pipe with a minimum 6-inch metal toe plate (cross-section view). Make all fittings watertight. A standard T-section fitting may also be used at the inlet.
2. Use an earthen diversion to direct surface runoff into the temporary slope drain. Make the height of the berm over the drain conduit a minimum of 1.5 ft and at least 6 inches higher than the adjoining berm on either side. The lowest point of the diversion berm should be a minimum of 1 ft above the top of the drain so that design flow can freely enter the pipe.
3. Protect the outlet of the slope drain from erosion with riprap dissipator.
